Reflection

1. Since my file name is Exercise1.java, from the original “public class BadLogin extends JFrame and public class BadLogin” (line 4 – line 5) and “public static void main String {new BadLogin}” (line 45), I change all the BadLogin to Exercise1

2. The code that was generated by Gemini used l1, l2, t1, t2 which can be confusing if it was a long code and we had to remember which variable that was used. Instead of labeling it with numbers and characters, I changed l1 as accountLabel, l2 as passwordLabel, t1 as accountField, and t2 as passwordField. Not much was changed from the logic of the code, but I am making it easier to differentiate each variable
